

## Dashboard

To welcome the user once he has entered a valid userid and password

## Error

To inform the user his password or userid is invalid

## LoginFilter

To validate the user id and password and pass the control accordingly

## Logout

To invalidate the user session

## UserList

To create an Arraylist of userids and passwords. The userid entered in html form is validated against this list.

## UserObject

POJO class which will create an object to store userid and password

## **Brief Flow**

Once the project is launched in the tomcat server, the index.html will accept the userid and password and call post of dashboard.

The filter is called implicitly, once validated it moves further in the chain to dashboard

In case the validation fails it is redirected to error
